#### Orientation

### What is VA FileMan?

VA FileMan is the database management system for the Veterans Health Information Systems and Technology Architecture user (VistA) environment. VA FileMan creates and maintains a database management system that includes features such as:

- Report writer
- Data dictionary manager
- Scrolling and screen-oriented data entry
- Text editors
- Programming utilities
- Tools for sending data to other systems
- File archiving

VA FileMan can be used as a standalone database, as a set of interactive or "silent" routines, or as a set of application utilities; in all modes, it is used to define, enter, and retrieve information from a set of computer-stored files, each of which is described by a data dictionary.

VA FileMan is a public domain software package that is developed and maintained by the Department of Veterans Affairs. It is widely used by VA medical centers and in clinical, administrative, and business settings in this country and abroad.

CAUTION: Programmer access in VistA is defined as DUZ(0)="@". It grants the privilege to become a developer in VistA. Programmer access allows you to work outside many of the security controls enforced by VA FileMan, enables access to all VA FileMan files, access to modify data dictionaries, etc. It is important to proceed with caution when having access to the system in this way.

#### How to Use this Manual

The VA FileMan Technical Manual provides information about the technical structure of VA FileMan. It includes the following information about VA FileMan:

- Implementation and Maintenance
- Files
- Routines and Callable Routines/Entry Points/Application Programming Interfaces (APIs)
- Exported Options
- Cross-References
- Archiving and Purging
- External Relationships
- Internal Relationships
- Package-Wide Variables

- Globals
- Security

**REF:** For VA FileMan installation instructions in the VistA environment, see the VA FileMan Installation Guide and any national patch description of the patch being released.

#### **Intended Audience**

The intended audience of this manual is all key stakeholders. The stakeholders include the following: It also contains material specifically intended for VA's Veterans Health Information Systems and Technology Architecture (VistA) systems managers and application developers.

- Information Resource Management (IRM)—System administrators at Department of Veterans Affairs (VA) sites who are responsible for computer management and system security on the VistA M Servers.
- Product Development (PD)—VistA legacy development teams.
- Product Support (PS).

#### **Disclaimers**

#### **Software Disclaimer**

This software was developed at the Department of Veterans Affairs (VA) by employees of the Federal Government in the course of their official duties. Pursuant to title 17 Section 105 of the United States Code this software is *not* subject to copyright protection and is in the public domain. VA assumes no responsibility whatsoever for its use by other parties, and makes no guarantees, expressed or implied, about its quality, reliability, or any other characteristic. We would appreciate acknowledgement if the software is used. This software can be redistributed and/or modified freely provided that any derivative works bear some notice that they are derived from it, and any modified versions bear some notice that they have been modified.

CAUTION: To protect the security of VistA systems, distribution of this software for use on any other computer system by VistA sites is prohibited. All requests for copies of this software for *non*-VistA use should be referred to the VistA site's local Office of Information Field Office (OIFO).

#### **Documentation Disclaimer**

This manual provides an overall explanation of VA FileMan and the functionality contained in VA FileMan 22.0; however, no attempt is made to explain how the overall VistA programming system is integrated and maintained. Such methods and procedures are documented elsewhere. We suggest you look at the various VA Internet and Intranet Websites for a general orientation to VistA. For example, visit the Office of Information and Technology (OI&T) VistA Development Intranet website.

DISCLAIMER: The appearance of any external hyperlink references in this manual does not constitute endorsement by the Department of Veterans Affairs (VA) of this Website or the information, products, or services contained therein. The VA does not exercise

any editorial control over the information you find at these locations. Such links are provided and are consistent with the stated purpose of this VA Intranet Service.

#### **Documentation Conventions**

This manual uses several methods to highlight different aspects of the material:

• Various symbols are used throughout the documentation to alert the reader to special information. Table 2 gives a description of each of these symbols:

Table 2. Documentation symbol descriptions

Symbol	Description	
1	<b>NOTE / REF:</b> Used to inform the reader of general information including references to additional reading material.	
A	<b>CAUTION / RECOMMENDATION / DISCLAIMER:</b> Used to caution the reader to take special notice of critical information.	

- Descriptive text is presented in a proportional font (as represented by this font).
- Conventions for displaying TEST data in this document are as follows:
  - The first three digits (prefix) of any Social Security Numbers (SSN) begin with either "000" or "666".
  - o Patient and user names are formatted as follows:
    - < Application Name/Abbreviation/Namespace > PATIENT,[N] and
    - <Application Name/Abbreviation/Namespace>USER,[N]

Where "<*Application Name/Abbreviation/Namespace*>" is defined in the Approved Application Abbreviations document and "N" represents the first name as a number value or spelled out and incremented with each new entry. For example, in VA FileMan (FM) test patient and user names would be documented as follows:

- FMPATIENT,ONE; FMPATIENT,TWO; FMPATIENT,THREE; FMPATIENT,14, etc.
- FMUSER,ONE; FMUSER,TWO; FMUSER,THREE; FMUSER,14, etc.
- "Snapshots" of computer online displays (i.e., screen captures/dialogues) and computer source code, if any, are shown in a *non*-proportional font and enclosed within a box.
  - User's responses to online prompts are **bold** typeface and highlighted in yellow (e.g., <<u>Enter></u>).
  - o Emphasis within a dialogue box is **bold** typeface and highlighted in blue (e.g., **STANDARD LISTENER: RUNNING**).
  - o Some software code reserved/key words are **bold** typeface with alternate color font.
  - References to "<Enter>" within these snapshots indicate that the user should press the Enter key on the keyboard. Other special keys are represented within <> angle brackets. For example, pressing the PF1 key can be represented as pressing <PF1>.

o Author's comments are displayed in italics or as "callout" boxes.

**NOTE:** Callout boxes refer to labels or descriptions usually enclosed within a box, which point to specific areas of a displayed image.

All uppercase is reserved for the representation of M code, variable names, or the formal name of
options, field/file names, and security keys (e.g., DIEXTRACT).

**NOTE:** Other software code (e.g., Delphi/Pascal and Java) variable names and file/folder names can be written in lower or mixed case (e.g., CamelCase).

# **Documentation Navigation**

This document uses Microsoft® Word's built-in navigation for internal hyperlinks. To add **Back** and **Forward** navigation buttons to your toolbar, do the following:

- 1. Right-click anywhere on the customizable Toolbar in Word (*not* the Ribbon section).
- 2. Select Customize Quick Access Toolbar from the secondary menu.
- 3. Select the drop-down arrow in the "Choose commands from:" box.
- 4. Select **All Commands** from the displayed list.
- 5. Scroll through the command list in the left column until you see the **Back** command (green circle with arrow pointing left).
- 6. Select/Highlight the **Back** command and select **Add** to add it to your customized toolbar.
- 7. Scroll through the command list in the left column until you see the **Forward** command (green circle with arrow pointing right).
- 8. Select/Highlight the Forward command and select **Add** to add it to your customized toolbar.
- 9. Select **OK**.

You can now use these **Back** and **Forward** command buttons in your Toolbar to navigate back and forth in your Word document when clicking on hyperlinks within the document.

**NOTE:** This is a one-time setup and is automatically available in any other Word document once you install it on the Toolbar.

# **VA FileMan Coding Conventions**

#### Non-Standard M Features

Z-commands and Z-functions are avoided throughout VA FileMan routines. For certain purposes (e.g., allowing terminal breaking and spooling to a Standard Disk Processor [SDP] disk device), VA FileMan executes lines of *non*-standard M code out of the MUMPS OPERATING SYSTEM file (#.7). The *non*-standard code used (if any) depends on the answer to the prompt:

Figure 1. Type of M system prompt

TYPE OF MUMPS SYSTEM YOU ARE USING:

This prompt appears during the DINIT initialization routine. Answering OTHER to this question ensures that VA FileMan uses only standard M code.

VA FileMan also makes use of *non*-standard M code that is stored in the %ZOSF global:

- If VA FileMan is installed on a system that contains Kernel, it uses the %ZOSF global created by Kernel.
- If it is being used without Kernel (i.e., standalone), the necessary %ZOSF nodes are set for many operating systems by running DINZMGR in the Manager account.

**REF:** For details, see the "System Management" section in the VA FileMan Advanced User Manual.

String-valued subscripts (up to 30 characters long) are used extensively but only in the \$ORDER collating sequence approved by the MUMPS Development Committee (MDC). Non-negative integer and fractional canonic numbers collate ahead of all other strings.

The \$ORDER function is used at several points in VA FileMan's code. VA FileMan routines assume that reference to an undefined global subscript level sets the naked indicator to that level, rather than leaving it undefined. In all other respects, the VA FileMan code conforms to the 1995 ANSI Standard for the M language with Type A extensions.

#### Routine, Variable, and Global Names

In keeping with the convention that all programs that are a part of the same application or utility package should be namespaced, all VA FileMan routine names begin with DI or DD. (The "Device Handling for Standalone VA FileMan" section in the VA *FileMan Advanced User Manual* explains that some DI\* routines are renamed in the Manager account.) The DINIT routine initializes VA FileMan. The DI routine itself is the main option reader.

**REF:** For more information on the DI routine, see the "^DI: Programmer Access" section in the *VA FileMan Developer's Guide*.

Except in DI, the routines do *not* contain unargumented or exclusive KILL commands. All multicharacter local variable names created by VA FileMan routines begin with % or the letter **D**, or consist of one uppercase letter followed by one numeral [except that IO(0), by convention, contains the \$I value of the signon device]. Since VA FileMan uses single character variable names extensively, do *not* use them in code that is executed from within VA FileMan programming hooks unless their use is documented in the hook's description or you NEW them. Also, do *not* expect single character variables to return unchanged after calling a VA FileMan entry point.

The following local variables are of special importance in the VA FileMan routines:

Table 3. VA FileMan routine variables and default values

Variable	Description	Default Value
DT	If defined, it is assumed to be the current date. For example:  June 1, 1987 is DT=2870601.	Today's date; derived from \$H
DTIME	If defined, it is the integer value of the number of seconds the user has to respond to a timed read.	300
DUZ	If defined, it is assumed to be the User Number; a positive	0

Variable	Description	Default Value
	number uniquely identifying the current user.	
DUZ(0)	If defined, it is assumed to be the FileMan Access Code, which is a character string describing the user's security clearance with regard to files, templates, and data fields within a file.	ш
	REF: See the "Data Security" section in the VA FileMan Advanced User Manual.	
	Setting DUZ(0) equal to the at-sign ("@") overrides all security checks and allows special programmer features that are described later. If the user's M implementation supports terminal break, a developer is allowed to break execution at any point, whereas a user who does <i>not</i> have programmer access can only break during output routines.	
U	If defined, it is equal to a single caret ("A") character.	" <b>V</b> "

VA FileMan routines explicitly refer to the following globals:

Table 4. VA FileMan routine global references

Global	Description		
^DD	All attribute dictionaries.		
^DDA	Data dictionary audit trail.		
^DI	Data types.		
^DIA	Data audit trail.		
^DIAR	Archival activity and Filegrams.		
^DIBT	Sort templates and the results of file searches.		
^DIC	Dictionary of files.		
^DIE	Input templates.		
^DIPT	Print templates and Filegram templates.		
^DIST	ScreenMan forms and blocks and Alternate Editors.		
^DISV	Most recent lookup value in any file or subfile (by DUZ).		
^DIZ	Default location for new data files as they are created.		
^DOPT	Option lists.		
^DOSV	Statistical results.		
^%ZOSF	M vendor-specific executable code.		

The routines use the  $^{\prime}$ UTILITY and  $^{\prime}$ TMP globals for temporary scratch space. The  $^{\prime}$ XUTL global is also used if you are running some M implementations.

### **Delimiters within Strings**

The caret ("^") character is conventionally used to delimit data elements that are strung together to be stored in a single global node. A corollary of this rule is that the routines almost never allow input data to contain carets; the user types a caret ("^") to change or terminate the sequence of questions being asked. Within ^-pieces, semicolons (";") are usually used as secondary delimiters, and colons (";") as tertiary delimiters.

VA FileMan routines use the local variable **U** as equal to the single caret ("^") character.

#### **Canonic Numbers**

VA FileMan recognizes only canonic numbers. A canonic number is a number that does *not* begin or end with meaningless zeroes. For example, 7 is a canonic number, whereas 007 and 7.0 are *not* canonic numbers.

#### **How to Obtain Technical Information Online**

Exported VistA M Server-based software file, routine, and global documentation can be generated through the use of Kernel, MailMan, and VA FileMan utilities.

**NOTE:** Methods of obtaining specific technical information online are indicated where applicable under the appropriate section.

### **Help at Prompts**

VistA M Server-based software provides online help and commonly used system default prompts. Users are encouraged to enter question marks at any response prompt. At the end of the help display, you are immediately returned to the point from which you started. This is an easy way to learn about any aspect of the software.

# **Obtaining Data Dictionary Listings**

Technical information about VistA M Server-based files and the fields in files is stored in data dictionaries (DD). You can use the List File Attributes option [DILIST] on the Data Dictionary Utilities menu [DI DDU] in VA FileMan to print formatted data dictionaries.

**REF:** For details about obtaining data dictionaries and about the formats available, see the "List File Attributes" section in the "File Management" section in the *VA FileMan Advanced User Manual*.

### **Assumptions**

This manual is written with the assumption that the reader is familiar with the following:

- VistA computing environment:
  - Kernel—VistA M Server software
  - o VA FileMan data structures and terminology—VistA M Server software
- Microsoft<sup>®</sup> Windows environment
- M programming language

#### **Reference Materials**

Readers who wish to learn more about VA FileMan should consult the following documents:

- VA FileMan Release Notes
- VA FileMan Installation Guide
- VA FileMan Technical Manual (this manual)
- VA FileMan User Manual (PDF and HTML format)
- VA FileMan Advanced User Manual (PDF and HTML format)
- *VA FileMan Developer's Guide* (PDF and HTML format)

**REF:** Zip files of the VA FileMan documentation in HTML format are located on the VA FileMan Intranet Product website and VDL at: http://www.va.gov/vdl/application.asp?appid=5.

Using a Web browser, open the **HTML** documents "table of contents" page (i.e., index.shtml). The *VA FileMan User Manual*, the *VA FileMan Advanced User Manual*, and the *VA FileMan Developer's Guide* are all linked together.

VistA documentation is made available online in Microsoft<sup>®</sup> Word format and in Adobe<sup>®</sup> Acrobat Portable Document Format (PDF). The PDF documents *must* be read using the Adobe<sup>®</sup> Acrobat Reader, which is freely distributed by Adobe<sup>®</sup> Systems Incorporated at: <a href="http://www.adobe.com/">http://www.adobe.com/</a>

VistA software documentation can be downloaded from the VA Software Document Library (VDL) at: <a href="http://www.va.gov/vdl/">http://www.va.gov/vdl/</a>

**REF:** VA FileMan manuals are located on the VDL at: <a href="http://www.va.gov/vdl/application.asp?appid=5">http://www.va.gov/vdl/application.asp?appid=5</a>

VistA documentation and software can also be downloaded from the Product Support (PS) Anonymous Directories.

### 1 Introduction

VA FileMan is a database management system (DBMS) consisting of computer routines written in American National Standards Institute (ANSI) Standard M, along with associated files. Developed with portability as a goal, VA FileMan runs on all major implementations of ANSI M and on hardware platforms ranging from PCs to mainframes.

Developers and non-developers use VA FileMan alike. VA FileMan can be used as a standalone database or as a set of application utilities. In either mode, it is used to define, enter, and retrieve information from a set of computer-stored files, each of which is described by the data dictionary.

VA FileMan is a public domain software package and is widely used in clinical, administrative, and business settings in the United States and abroad.

# 2 Implementation and Maintenance

VA FileMan is initialized with the DINIT routine, followed by an install using the Kernel Distribution and Installation system (KIDS) as directed in the *VA FileMan Installation Guide*. DINIT only needs to be run once; it is nondestructive to a system if run again. Standalone VA FileMan sites do *not* perform the KIDS install.

VA FileMan routines and globals occupy approximately 3.5 MB of memory. The size of the globals, particularly those that store file data, increases when VA FileMan is used.

Since VA FileMan provides the DBMS upon which all files in Veterans Health Information Systems and Technology Architecture (VistA) are based, it *must* be present on all VistA systems. The current version of VA FileMan is designed for complete backward compatibility; files and applications developed under prior versions remain usable.

If used with Kernel, all or part of the VA FileMan options can be given to users. Those who are able to use programmer mode can also invoke the main menu from the M prompt. Anyone can use applications developed with VA FileMan, whether or not direct access to VA FileMan itself is allowed.

**REF:** For more information on programmer mode, see the "^DI: Programmer Access" section in the "Developer's Tools" section in the *VA FileMan Developer's Guide*.

When used with Kernel, VA FileMan allows the user to print multiple copies. In order to do this, a temporary storage location *must* be allocated on the system with a corresponding DEVICE file (#3.5) entry that uses a sequential disk processor (SDP) device type.

**REF:** The *Kernel Systems Management Guide* contains specific instructions on how to set up an SDP device for different operating systems.

The ^DISV global contains the most recent lookup value for files and subfiles; it is used to process <**Spacebar**><**Enter**> input. The ^DOSV global contains results of statistical operations. These globals can grow to considerable size and should be monitored. It is safe to periodically KILL these globals. Users should *not* be logged on to the system when the globals are KILLed in order to minimize inconvenience and avoid data corruption.

The site manager *must* monitor the proliferation of routines with names like ^DISZ*nnnn* where "*nnnn*" is a four-digit number with leading zeros. These routines are created when compiled sorts are run. Ordinarily, they are deleted after the sort completes, but, if the system goes down or the job fails with an

error, they can remain. When users are *not* on the system, the routine ENRLS^DIOZ can be run to clean up these routines and to release the "*nnnn*" numbers for reuse.

**REF:** For more information on the ENRLS^DIOZ utility, see the "COMPILED ROUTINE File Cleanup: ENRLS^DIOZ()" section in the "System Management" section in the "Tools" section in the *VA FileMan Advanced User Manual*.

# 3 Files

This section lists all the VA FileMan files, file numbers, global locations, and a brief description of each. Data exported with standalone VA FileMan is also indicated.

VA FileMan uses files numbered between 0 and 2..

VA FileMan files should *not* be altered, per VHA Directive 10-93-142.

**Table 5. VA FileMan File List** 

File #	File Name	Global Location	Description
.11	INDEX	^DD("IX",	The INDEX file stores information about New-Style cross-references defined on a file. Whereas Traditional cross-references are stored under the 1 nodes of the ^DD for a particular field, New-Style cross-references are stored in this file and can consist of one field (simple cross-references), as well as more than one field (compound cross-references).
.2	DESTINATION	^DIC(.2	The DESTINATION file documents the location where data is used.
.31	KEY	^DD("KEY",	The KEY file stores information about keys on a file or subfile. A key is a set of one or more fields that uniquely identifies a record in a file. If more than one set of fields can uniquely identify a record, one of those sets should be designated the primary key; all others should be designated secondary keys. The primary key is the principal means of identifying records in the file. To allow VA FileMan to enforce key uniqueness, the database designer <i>must</i> define a regular index that consists of all the fields that make up the key. This index is called the uniqueness index. All key fields <i>must</i> have values. They cannot be null.
.4	PRINT TEMPLATE	^DIPT(	The PRINT TEMPLATE file stores VA FileMan PRINT templates. Exported PRINT templates include:  • CAPTIONED  • FILE SECURITY CODES  • DI-PKG-DEFAULT-DEFINITION  • DDXP FORMAT DOC  • DDXP FORMAT DOC HDR
.401	SORT TEMPLATE	^DIBT(	The SORT TEMPLATE file stores VA FileMan SORT, SEARCH, and INQUIRE templates.
.402	INPUT TEMPLATE	^DIE(	The INPUT TEMPLATE file stores VA FileMan INPUT templates.

File #	File Name	Global Location	Description
.403	FORM	^DIST(.403	The FORM file stores forms used by VA FileMan to display screens. The DDXP FF FORM1 and various forms used by ScreenMan's Form Editor utility are exported.
.404	BLOCK	^DIST(.404	The BLOCK file stores blocks used to build forms for screen display. Blocks are exported for use with the forms sent with VA FileMan.
.44	FOREIGN FORMAT	^DIST(.44	The FOREIGN FORMAT file holds specifications for sending data to an application outside of M. Several Foreign Formats are exported.
.46	IMPORT TEMPLATE	^DIST(.46,	The IMPORT TEMPLATE file holds specifications for importing information from an application outside of M into a VA FileMan file.
.5	FUNCTION	^DD("FUNC"	The FUNCTION file stores the computed functions available in VA FileMan. The functions described in the VA FileMan Advanced User Manual are exported.  REF: For more information on functions, see the "VA FileMan Functions" section in the "Tools" section in the VA FileMan Advanced User Manual.
.6	DD AUDIT	^DDA(	The DD AUDIT file stores the changes made to data dictionaries.
.7	MUMPS OPERATING SYSTEM	^DD("OS"	The MUMPS OPERATING SYSTEM file stores the operating systems recognized by VA FileMan along with operating systemspecific data. This data is exported.
.81	DATA TYPE	^DI(.81	The DATA TYPE file stores information about the DATA TYPEs known to VA FileMan. Several DATA TYPEs are exported.
.83	COMPILED ROUTINE	^DI(.83	The COMPILED ROUTINE file contains a list of numbers (to be used to create compiled Sort routines) and a flag to indicate whether a number is currently in use.
.84	DIALOG	^DI(.84	The DIALOG file contains text used to "talk" to the user (error messages, help text, prompts). Entries under IEN 10,000 are exported by VA FileMan and are used in VA FileMan routines.
.85	LANGUAGE	^DI(.85	The LANGUAGE file is used to reference subentries in the DIALOG file for user dialogue in foreign languages and contains M code used to perform data transformations for such things as dates and numbers to non-English formats.

File #	File Name	Global Location	Description
1	FILE	^DIC(	The FILE file stores the name, number, global name or location, package name, security access, and developer of VA FileMan created files. Data for the VA FileMan files is exported.
1.1	AUDIT	^DIA(	The AUDIT file stores the date and time, user's name, and old and new data values of changes made to audited fields.
1.11	ARCHIVAL ACTIVITY	^DIAR(1.11	The ARCHIVAL ACTIVITY file stores information about and status of archiving and extract activities.
1.12	FILEGRAM HISTORY	^DIAR(1.12	The FILEGRAM HISTORY file stores information and status of Filegrams.
1.13	FILEGRAM ERROR LOG	^DIAR(1.13	The FILEGRAM ERROR LOG file stores information about Filegram errors and the text of the affected Filegram.
1.2	ALTERNATE EDITOR	^DIST(1.2	The ALTERNATE EDITOR file stores information about the editors that can be used to edit VA FileMan's WORD-PROCESSING-type fields. Data for the Line Editor and the Screen Editor is exported.
1.521	SQLI_SCHEMA	^DMSQ("S",	The SQLI_SCHEMA file stores a set of tables and domains; a subset of catalog and environment.
1.52101	SQLI_KEY_WORD	^DMSQ("K",	The SQLI_KEY_WORD file stores the SQL identifiers that <i>cannot</i> be used for column and table names. SQL, ODBC, and vendors all have lists of restricted words, which should be put in this table before SQLI table generation.
1.5211	SQLI_DATA_TYPE	^DMSQ("DT",	<ul> <li>The SQLI_DATA_TYPE file stores a set of values from which all domains of that type can be drawn:</li> <li>PRIMARY_KEY—Set of all primary keys (in SQLI_TABLE_ELEMENT file [#1.5216], type P).</li> <li>CHARACTER—Set of all character strings of length less than 256.</li> <li>INTEGER—Set of all cardinal numbers.</li> <li>NUMERIC—Set of all real numbers.</li> <li>DATE—Set of all date valued tokens.</li> <li>TIME—Set of all time valued tokens.</li> <li>MOMENT—Set of all tokens that have both a date and a time value.</li> <li>BOOLEAN—Set of all tokens that evaluate to true or false only.</li> <li>MEMO—Set of all character strings of length greater than 255.</li> </ul>

File #	File Name	Global Location	Description
1.5212	SQLI_DOMAIN	^DMSQ("DM",	The SQLI_DOMAIN file stores the set from which all objects of that domain <i>must</i> be drawn. In SQLI, all table elements (SQLI_TABLE_ELEMENT file [#1.5216]) have a domain that restricts them to their domain set. For each DATA TYPE there is a domain of the same name, representing the same set. Other domains have different set membership restrictions.  Each domain has a DATA TYPE, which determines the rules for comparing values from different domains, and the operators that can be used on them.  The PRIMARY_KEY DATA TYPE and domain is unique to SQLI. It is used to relate primary keys to foreign keys unambiguously.  REF: For information on table elements, see the SQLI_TABLE_ELEMENT file (#1.5216).
1.5213	SQLI_KEY_FORMAT	^DMSQ("KF",	The SQLI_KEY_FORMAT file stores strategies for converting base values into key values. Soundex and uppercase conversion are common examples. This implies that comparisons of key values with base values must be preceded by conversion of the base value to a key value. Key formats are frequently lossy; they cannot be converted uniquely back to base format.
1.5214	SQLI_OUTPUT_FORMAT	^DMSQ("OF",	The SQLI_OUTPUT_FORMAT file stores strategies for converting base values to external values. In VA FileMan, they are used to convert references to pointers to their text values. They are also used for the SET OF CODES type.  SQLI projects POINTER TO A FILE and SET OF CODES as calls to \$\$GET1^DIQ, VARIABLE-POINTERs into calls to \$\$EXTERNAL^DILFD.  Vendors and other users of SQLI can implement their own conversions to improve performance.
1.5215	SQLI_TABLE	^DMSQ("T",	The SQLI_TABLE file stores the descriptor of a set of table elements: includes name and file number (see the SQLI_TABLE_ELEMENT file [#1.5216]). Each ^DD(DA) represents a table in a relational model of VA FileMan. Further, each index represents a table.  Each schema contains multiple tables. Each table contains just one primary key, but

File #	File Name	Global Location	Description
			multiple columns, foreign keys and indices.
1.5216	SQLI_TABLE_ELEMENT	^DMSQ("E",	The SQLI_TABLE_ELEMENT file contains the names and domains of primary keys, columns, and foreign keys. Each represents the relational concept of an attribute, whose essential characteristics are a name (unique by relation) and a domain.  REF: For more information, see the SQLI_PRIMARY_KEY,
			SQLI_COLUMN, and SQLI_FOREIGN KEY files.
1.5217	SQLI_COLUMN	^DMSQ("C",	The SQLI_COLUMN file stores a set of formatting and physical structure specifications. Each column specification has a column type table element (SQLI_TABLE_ELEMENT file) that contains the relational specifications, name, and domain. The column specification contains those attributes required to locate the value in the global structure and to project the value to the user.
			REF: For information on table elements, see the SQLI_TABLE_ELEMENT file (#1.5216).
1.5218	SQLI_PRIMARY_KEY	^DMSQ("P",	The SQLI_PRIMARY_KEY file stores a chosen set of columns that uniquely identify a table. In the relational model (as in set theory) the columns of a primary key are <i>not</i> ordered. In SQLI, they <i>must</i> be, in order to map to the quasi-hierarchical model of M globals.  VA FileMan subfiles (Multiples) have a primary key element for each parent plus one for the subfile. Each contains a pointer to its primary key table element (SQLI_TABLE-ELEMENT file), a sequence, and a column in
			the local base table (SQLI_COLUMN file).  REF: For information, see the SQLI_TABLE_ELEMENT and SQLI_COLUMN files above.
1.5219	SQLI_FOREIGN_KEY	^DMSQ("F",	The SQLI_FOREIGN_KEY file stores a set of columns in a table that match the primary key of another table. They represent an explicit join of the two tables. Each foreign key element points to its table element (SQLI_TABLE_ELEMENT file [#1.5216]), a column in the local table (SQLI_COLUMN file), and a primary key element of a foreign

File#	File Name	Global Location	Description
			table (SQLI_PRIMARY_KEY file). The primary key table element of the foreign table has the domain of that table, which makes the connection.  REF: For more information, see the SQLI_TABLE_ELEMENT, SQLI_COLUMN, and SQLI_PRIMARY_KEY files.
1.52191	SQLI_ERROR_TEXT	^DMSQ("ET",	The SQLI_ERROR_TEXT file stores a numbered list of error messages, autogenerated by ERR^DMSQU.
1.52192	SQLI_ERROR_LOG	^DMSQ("EX",	The SQLI_ERROR_LOG file stores a log of all errors encountered while compiling SQLI. It generates the error text table (SQLI_ERROR_TEXT file) on a LAYGO basis; errors are added only when they occur. If DBS errors triggered the error, the DIALOG file reference is also saved.  REF: For more information, see the SQLI_ERROR_TEXT and DIALOG files.

The DINIT routines install the files listed in Table 5.

Another set of init routines (DIPKINIT), called by DINIT during installation, is sent with each release of VA FileMan. These routines install the PACKAGE file (#9.4), if you are running a version of Kernel prior to Version 8.0 or if you are running standalone VA FileMan without Kernel. The PACKAGE file (#9.4) is necessary to build inits using DIFROM. A single entry for DIPK is created in the PACKAGE file (#9.4) by the DIPKINITs.

**REF:** For more information on DIFROM, see the "DIFROM" section in the "Developer's Tools" section in the VA *FileMan Developer's Guide*.

CAUTION: The Kernel Installation and Distribution System (KIDS) replaced the use of DIFROM as the method of exporting software packages in the VA. The version of DIFROM released with VA FileMan 22.0 does *not* transport the new Key and Index structures and should *not* be used to transport any file making use of these new features.

# 3.1 Pointer Map

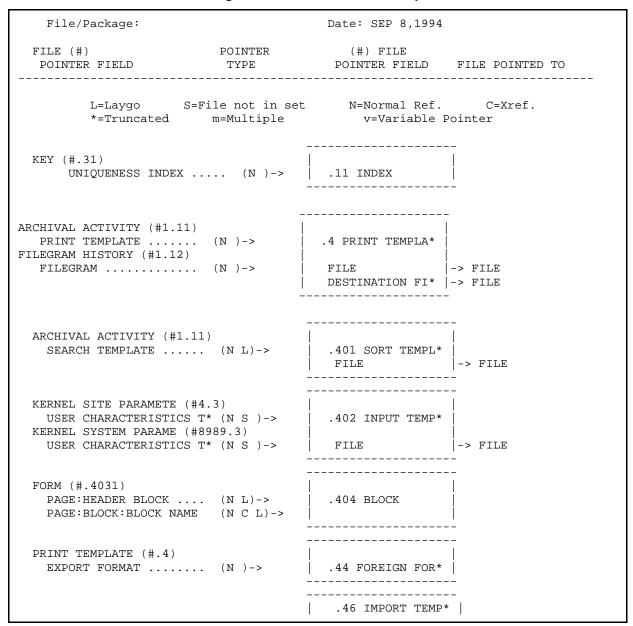

<u>Figure 2</u> is a diagram of the pointer relationships between fields in VA FileMan's files. This pointer map reflects the relationships that exist in a VA FileMan environment running Kernel 8.0. As files are added to a system, new pointer relationships can be created; thus, the actual map for different operational systems can vary.

The diagram in <u>Figure 2</u> was created using the Map Pointer Relations option on the Data Dictionary Utilities submenu.

**REF:** For more information about creating and reading this map, see the "Map Pointer Relations option" section in the "List File Attributes" section in the "File Management" section in the *VA FileMan Advanced User Manual*.

# 4 Routines and Callable Routines/Entry Points/Application Programming Interfaces (APIs)

This section lists and briefly describes the VA FileMan routines (see <u>Table 6</u>). VA FileMan routines should *not* be altered, per Veterans Health Administration (VHA) Directive 10-93-142.

The callable entry points/Application Programming Interfaces (APIs) for those VA FileMan routines that can be invoked from other applications are shown in the "Callable Entry Point" column in <u>Table 6</u>.

**REF:** The callable routines/APIs, ScreenMan, and Database Server (DBS) calls are described in detail (including their function, required variables, and any restrictions) in the *VA FileMan Developer's Guide*:

- Callable routines/APIs—See the "Major APIs" and "Other APIs" sections in the VA FileMan Developer's Guide.
- ScreenMan—See the "ScreenMan" section in the VA FileMan Developer's Guide.
- Database Server (DBS) calls—See the "Database Server (DBS)" section in the "Major APIs" section in the VA FileMan Developer's Guide.

**REF:** The Direct mode utilities, which can only be called directly from M and ScreenManspecific utilities, are listed in Sections <u>4.1</u> and <u>4.2</u>, and are also described in the *VA FileMan Developer's Guide*.

**REF:** Routine mapping is described in Section 4.3.

**Table 6. VA FileMan Routine and Callable Entry Points** 

Routine	Callable Entry Point	Description

**REF:** For details on all VA FileMan callable routines/entry points/APIs, see the *VA FileMan Developer's Guide*.

#### 4.1 Direct Mode Utilities

In addition to the callable entry points shown in <u>Table 6</u>, there are a few other entry points into VA FileMan routines. Unlike the callable entry points, these entries *cannot be used within application programs*. Only users with programmer access can invoke the following direct mode utilities from the M prompt:

- C^DI
- D^DI
- P^DI
- Q^DI

**REF:** For more information on these direct mode utilities, see the "^DI: Programmer Access" section in the "Developer Tools" section in the VA FileMan Developer's Guide.

## 4.2 ScreenMan-Specific Utilities

The following are ScreenMan-specific utilities:

- ^DDGF
- CLONE^DDS
- PRINT^DDS
- RESET^DDS

**REF:** For more information on these ScreenMan-specific utilities, see the "Prog. Mode Utilities" section in the "ScreenMan Forms" section in the "ScreenMan" section in the *VA FileMan Developer's Guide*.

## 4.3 Mapping Routines

Routine mapping is at the discretion of the systems manager. The RTHIST routines provide a method for each site to determine the extent to which certain routines are used.

The following list is provided as a recommendation only:

- In the MGR account:
  - o %DT, %DTC, %RCR
- In the VAH account:
  - o DDBR\*
  - o DDIOL
  - o DDS, DDS0\*, DDS1\*, DDSCOM, DDSR\*, DDSU
  - o DDW4, DDW5, DDW6, DDWT1
  - DIAC, DIALOG\*
  - o DIC, DIC0, DIC1\*, DIC2, DIC3
  - o DICA, DICA1, DICA2, DICA3
  - o DICD
  - o DICF\*
  - o DICL\*
  - o DICM\*
  - o DICN\*
  - o DICQ\*
  - o DICR, DICRW
  - o DICU\*
  - o DIE, DIE0, DIE1, DIE2, DIE3, DIE9, DIE17
  - o DIED
  - o DIEF\*

- o DIEH\*
- o DIEQ\*
- o DIEV\*
- o DIK, DIK1, DIKC, DIKC1, DIKC2, DIKCU, DIKCU1, DIKCU2
- o DIL\*
- o DIO\*
- o DIP, DIP0, DIP1\*, DIP2, DIP21, DIP22, DIP3\*, DIP4, DIP5
- o DIQG, DIQGQ, DIQGU\*
- o DIW\*
- o DIR, DIR0, DIR01, DIR1, DIR2, DIR3, DIRQ

CAUTION: DIEZ\*, DIFRO\*, DIKZ\*, DIOZ\*, DIPZ\* must not be mapped.

# **5 Exported Options**

#### 5.1 Standalone VA FileMan

The exported menu structure of VA FileMan is displayed in Figure 3.

The following options are provided to standalone VA FileMan users

- Enter or Edit File Entries
- Print File Entries
- Search File Entries
- Modify File Attributes
- Inquire To File Entries

#### **Utility Functions:**

- Verify Fields
- Cross-Reference A Field or File
- Identifier
- Re-Index File
- Input Transform (Syntax)
- Edit File
- Output Transform
- Template Edit
- Uneditable Data
- Mandatory/Required Field Check
- Key Definition

#### Other Options:

- Filegrams:
  - o Create/Edit Filegram Template
  - o Display Filegram Template
  - o Generate Filegram
  - o View Filegram
  - o Specifiers
  - o Install/Verify Filegram

#### • Archiving:

- Select Entries to Archive
- Add/Delete Selected Entries
- o Print Selected Entries
- o Create Filegram Archiving Template
- o Write Entries to Temporary Storage
- Move Archived Data to Permanent Storage
- o Purge Stored Entries
- o Cancel Archival Selection
- Find Archived Entries

#### Auditing:

- o Fields Being Audited
- o Data Dictionaries Being Audited
- Purge Data Audits
- o Purge DD Audits
- o Turn Data Audit On/Off

#### • ScreenMan:

- o Edit/Create a Form
- o Run a Form
- o Delete a Form
- o Purge Unused Blocks

#### • Statistics:

- o Descriptive Statistics
- o Scattergram
- Histogram

#### • Extract Data to FileMan File

- o Select Entries to Extract
- Add/Delete Selected Entries
- o Print Selected Entries
- o Modify Destination File
- o Create Extract Template
- o Update Destination File
- o Purge Extracted Entries
- o Cancel Extract Selection

- o Validate Extract Template
- Data Export To Foreign Format
  - o Define Foreign File Format
  - o Select Fields For Export
  - o Create Export Template
  - o Export Data
  - o Print Format Documentation
- Import Data
- Browser
- Data Dictionary Utilities
  - o List File Attributes
  - o Map Pointer Relations
  - o Check/Fix DD Structure
- Transfer Entries
  - Transfer File Entries
  - o Compare/Merge File Entries

## 5.2 VA FileMan with Kernel

VA FileMan exports the options listed in <u>Figure 3</u>. They are installed if Kernel exists on your system. The top-level VA FileMan menu option, DIUSER, can be found on Kernel's EVE menu. The top-level menu option, DMSQ MENU, is *not* attached to any other existing menu; it is standalone, and can be assigned as needed.

#### 6 Cross-References

This section contains a description of the MUMPS-type cross-references that exist on fields in VA FileMan files. There are no bulletin or trigger cross-references in these files. All other cross-references are regular types used for lookup or sorting, or both.

The cross-references are grouped by file. The field affected is identified along with the cross-reference's name (or subscript location if there is no name) and a brief description. Many of these cross-references are described in more detail in the data dictionaries.

## 6.1 PRINT TEMPLATE File (#.4)

Table 7. PRINT TEMPLATE File (#.4)—Cross-references

Field	X-Ref ID	Description
NAME	F_file#	This cross-reference is used to quickly find all PRINT templates associated with a particular file.
	AF	This cross-reference sets up an "AF" cross-reference node for each field in a compiled PRINT template. The cross-reference has the form:  ^DIPT("AF",file#,field#,print template#)=""
FILE	F_file#	This cross-reference is used to quickly find all PRINT templates associated with a particular file.
TEMPLATE TYPE	FG	This cross-reference is used to do a quick lookup of FILEGRAM-type of PRINT templates.
	EX	This cross-reference is used to do a quick lookup of EXTRACT-type PRINT templates.

## 6.2 SORT TEMPLATE File (#.401)

Table 8. SORT TEMPLATE File (#.401)—Cross-references

Field	X-Ref ID	Description
NAME	F_file#	This cross-reference is used to quickly find all SORT templates associated with a particular file.
FILE	F_file#	This cross-reference is used to quickly find all SORT templates associated with a particular file.

# 6.3 INPUT TEMPLATE File (#.402)

Table 9. NPUT TEMPLATE File (#.402)—Cross-references

Field	X-Ref ID	Description
NAME	F_file#	This cross-reference is used to quickly find all INPUT templates associated with a particular file.
	AF	This cross-reference sets up an "AF" cross-reference node for each field in a compiled INPUT template. The cross-reference has the form:  ^DIE("AF",file#,field#,input template#)=""
FILE	F_file#	This cross-reference is used to quickly find all INPUT templates associated with a particular file.

# 6.4 FORM File (#.403)

Table 10. FORM File (#.403)—Cross-references

Field	X-Ref ID	Description
NAME	F1	This cross-reference is used to quickly find all ScreenMan forms associated with a particular file.
	AY	This cross-reference merely documents the existence of data stored under ^DIST(.403,form IEN,"AY"). This is where the compiled data for a form is stored.
PAGE NAME (subfield of PAGE Multiple)	С	This cross-reference stores the PAGE NAME converted to uppercase characters.
PRIMARY FILE	F	This cross-reference is used to quickly find all ScreenMan forms associated with a particular file.
IS THIS A POP UP PAGE? (subfield of PAGE Multiple)	AC	This cross-reference ensures that no header block, next page, or previous page is associated with a pop up page.

# 6.5 BLOCK File (#.404)

Table 11. BLOCK File (#.404)—Cross-references

Field	X-Ref ID	Description
CAPTION (subfield of FIELD Multiple)	С	This cross-reference is used for lookup of fields by CAPTION. It is also used for ^-jumping.
UNIQUE NAME (subfield of FIELD Multiple)	D	This cross-reference stores the UNIQUE NAME converted to uppercase characters.

# 6.6 IMPORT TEMPLATE File (#.46)

Table 12. IMPORT TEMPLATE File (#.46)—Cross-references

Field	X-Ref ID	Description
NAME	F1	Creates an index under F_file# that is used for lookup when the file number is known.
PRIMARY FILE	F	Same as F1.

# 6.7 FILE of Files (#1)

Table 13. FILE of Files (#1)—Cross-references

Field	X-Ref ID	Description
NAME	AD	This cross-reference sets and kills the "GL" node for the file. This node has the form:  ^DIC(file#,0,"GL")=file's global location
	AE	This cross-reference sets and kills the "NM" node for the file. This node has the form:  ^DIC(file#,0,"NM")=file's name

# 6.8 SQLI\_TABLE\_ELEMENT File (#1.5216)

Table 14. SQLI\_TABLE\_ELEMENT File (#1.5216)—Cross-references

Field	X-Ref ID	Description
E_TABLE	G	Table element by table, by name.
E_TYPE	F	Table element by table, by type.

# 6.9 **SQLI\_COLUMN File (#1.5217)**

Table 15. SQLI\_COLUMN File (#1.5217)—Cross-references

Field	X-Ref ID	Description
C_FIELD	D	Column by VA FileMan file number, by field number.

# 6.10 SQLI\_PRIMARY\_KEY File (#1.5218)

#### Table 16. SQLI\_PRIMARY\_KEY File (#1.5218)—Cross-references

Field	X-Ref ID	Description
P_SEQUENCE	С	Primary key by table, by sequence.

## 7 Archiving and Purging

## 7.1 Archiving

There are no package-specific archiving procedures in VA FileMan.

The generic archiving tool for VistA is a part of VA FileMan. It is described in the VA FileMan Advanced User Manual.

**REF:** For more information on archiving, see the "Archiving" section in the VA *FileMan Advanced User Manual*.

The Extract Tool provides a means of archiving data into a VA FileMan file. It is also described in the VA FileMan Advanced User Manual.

**REF:** For more information on the Extract Tool, see the "Extract Tool" section in the "Archiving" section in the VA *FileMan Advanced User Manual*.

## 7.2 Purging

Within VA FileMan, the only files that might grow large enough to require purging of data are the audit files:

- AUDIT (#1.1)
- DD AUDIT (#.6)

These files capture information about changes to data and to data dictionaries, respectively. These audits are started and stopped by using the options on the Auditing submenu. The amount of data accumulated is dependent both on the scope of the audit and its duration. Options are available to purge the AUDIT (#1.1) (Purge Data Audits) and the DD AUDIT file (#.6) (Purge DD Audits). Purging the audit files is optional. Decisions to purge *must* be made based on the size of the files and any need to retain the audit data.

**REF:** For instructions on the use of the Auditing options, see the "Auditing" section in the VA *FileMan Advanced User Manual*.

The Purge Stored Entries option on the Archiving submenu removes the data archived from the primary file and from the ARCHIVAL ACTIVITY file (#1.11) when the archiving process is complete. The Purge Stored Entries option should be run when each archiving action is finished in order to remove the archived data and clean up the files.

The Purge Extracted Entries option on the Extract Tool submenu removes extracted data from the primary file and from the ARCHIVAL ACTIVITY file (#1.11) when the extract process is complete. This option should be run when using the Extract Tool for archiving purposes to remove extracted data.

## 8 External Relationships

VA FileMan is designed to function as a standalone database management system. It can accomplish most of the activities described in the *VA FileMan Developer's Guide* and user manuals without relying on other software (except an implementation of ANSI Standard M on which to run).

When installing VA FileMan, you identify the current M operating system. An entry in the MUMPS OPERATING SYSTEM file (#.7) is selected. The information in this file allows things to be accomplished that are done differently by various implementations of M. In addition, when the DINZMGR routine is run during a standalone installation, %ZOSF global nodes are set in the Manager account. These nodes contain additional implementation-specific information that allows for expanded functionality.

**REF:** For details of installing standalone VA FileMan, see the "Standalone VA FileMan Installation" section in the VA FileMan Installation Guide.

By attending to at least minimal operating system concerns, VA FileMan can be installed *without* the remaining parts of Kernel *except* for the PACKAGE file (#9.4). The PACKAGE file (#9.4) is *not* a VA FileMan file; however, it is shipped with VA FileMan, and is installed automatically during the installation of VA FileMan, if either Kernel is *not* present or if a version prior to Kernel 8.0 is present. The PACKAGE file (#9.4) *must* be present on your system to use the DIFROM routines to export software packages.

CAUTION: The Kernel Installation and Distribution System (KIDS) replaced the use of DIFROM as the method of exporting software packages in the VA. The version of DIFROM released with VA FileMan 22.0 does *not* transport the new Key and Index structures and should *not* be used to transport any file making use of these new features.

VA FileMan's capability is enhanced when it is installed with Kernel and MailMan. Specifically, VA FileMan 22.0 is designed to work with Kernel 8.0 or later. For example, the following additional functionality is available when VA FileMan is installed with Kernel:

- User security via the NEW PERSON file (#200)
- Control of file access
- More sophisticated menu presentation
- Device control
- Queuing

The following additional functionality is available when VA FileMan is installed with MailMan:

- Bulletins, one of VA FileMan's cross-references, become operational when MailMan is installed to deliver the messages.
- Filegram options also require MailMan.

Kernel allows networking two CPUs with different operating systems. Kernel provides this ability by retrieving the type of operating system from ^%ZOSF("OS"). This global does *not* have to be replicated or translated; thus, a separate copy of the global can be stored on each CPU. When running standalone VA FileMan, the type of operating system is retrieved either from the second piece of ^%ZOSF("OS"), if the DINZMGR was run, or from ^DD("OS"). ^DD("OS") is the global location of the MUMPS

OPERATING SYSTEM file (#.7). The global ^DD *must* always be either replicated or translated across systems. In any case, VA FileMan uses the local DISYS variable to store the value of the current operating system. VA FileMan finds some operating system-specific code in nodes descending from ^DD("OS",DISYS); other code is found in ^%ZOSF nodes.

VA FileMan exports options and security keys with the DI and DD namespace for use by Kernel.

**NOTE:** Throughout the VA FileMan manuals, specific reference is made to Kernel or MailMan when either is needed for a function to work.

# 8.1 DBA Approvals and Database Integration Control Registrations (ICRs)

The Database Administrator (DBA) maintains a list of Integration Control Registrations (ICRs) or mutual agreements between software developers allowing the use of internal entry points or other software-specific features that are *not* available to the general programming public.

#### 8.1.1 ICRs—Current List for VA FileMan as Custodian

To obtain the current list of ICRs, if any, to which the VA FileMan software (DI) is a custodian, perform the following procedures:

- 1. Sign onto the **FORUM** system (forum.va.gov).
- 2. Go to the **DBA** menu [DBA].
- 3. Select the **Integration Agreements Menu** option [DBA IA ISC].
- 4. Select the **Custodial Package Menu** option [DBA IA CUSTODIAL MENU].
- 5. Choose the ACTIVE by Custodial Package option [DBA IA CUSTODIAL].
- 6. When this option prompts you for a package, enter **VA FILEMAN** or **DI**.
- 7. All current ICRs to which the VA FileMan software is a custodian are listed.

#### 8.1.2 ICRs—Detailed Information

To obtain detailed information on a specific integration control registration, perform the following procedures:

- 1. Sign onto the **FORUM** system (forum.va.gov).
- 2. Go to the **DBA** menu [DBA].
- 3. Select the **Integration Agreements Menu** option [DBA IA ISC].
- 4. Select the **Inquire** option [DBA IA INQUIRY].
- 5. When prompted for "INTEGRATION REFERENCES," enter the specific integration control registrations number of the ICR you would like to display.

50

6. The option then lists the full text of the ICR you requested.

## 8.1.3 ICRs—Current List for VA FileMan as Subscriber

To obtain the current list of ICRs, if any, to which the VA FileMan software (DI) is a subscriber, perform the following procedures:

- 1. Sign onto the **FORUM** system (forum.va.gov).
- 2. Go to the **DBA** menu [DBA].
- 3. Select the **Integration Agreements Menu** option [DBA IA ISC].
- 4. Select the **Subscriber Package Menu** option [DBA IA SUBSCRIBER MENU].
- 5. Choose the **Print ACTIVE by Subscribing Package** option [DBA IA SUBSCRIBER].
- 6. When prompted with "START WITH SUBSCRIBING PACKAGE," enter **VA FILEMAN** (uppercase). When prompted with "GO TO SUBSCRIBING PACKAGE," enter **VA FILEMAN** (uppercase).

51

7. All current ICRs to which the VA FileMan software is a subscriber are listed.

# 9 Internal Relationships

All options can be independently invoked.

None of the options require any special setup in order to run successfully.

# 10 Package-Wide Variables

VA FileMan package-wide or key variables that can be assumed to be defined at all times are the following:

**Table 17. Package-wide Variables** 

Variable	Description
DUZ	The internal entry number from the NEW PERSON file (#200).
DUZ(0)	The variable defining the user's access.
DUZ("LANG")	If running Kernel 8.0 or later, this variable refers to the language of the current user.
DT	The current date in VA FileMan internal format.
DTIME	The integer value of the number of seconds the user has to respond to a timed read.
U	The up-arrow (caret).

In addition, the following variable has a special meaning for VA FileMan although it is *not* always defined:

Table 18. Package-wide Variables—DISY (special Meaning)

Variable	Description
DISYS	The current M operating system—pointer to the MUMPS OPERATING SYSTEM file (#.7) contained in the first piece of ^DD("OS") and, if using Kernel, in the second piece of ^%ZOSF("OS").

## 10.1 Standards and Conventions (SAC) Exemptions

Beginning January 1, 1995, VA FileMan 22.0 has been granted exemptions from the following standards by the Programming Standards and Conventions Committee (SACC).

#### 10.1.1 STANDARD SECTION: 4B-Package-wide variables

Beginning December 22, 1994, VA FileMan is exempted from KILLing the listed variables in the following calls:

Table 19. List of variables VA FileMan is exempted from KILLing

Supported Reference	Variables
DIC	DA
FILE^DICN	DA
DIE	%,D,D0,DI,DQ,X,D1,%X,%Y
DIK	%,DA,DIC, X, Y
EN1^DIP	X
EN^DIQ1	%,D0,I,J,X,Y,C

#### 10.1.2 STANDARD SECTION: 6D-FM compatibility

- The following globals are exempt from VA FileMan compatibility:
  - o ^DISV
  - o ^DOSV
- VA FileMan may set a *non*-VA FileMan compatible node [e.g., ^XXX(File#, IEN,-9)] to record information about archival activity and may set *non*-VA FileMan compatible nodes ^(3) and ^(2) to store old and new values of any audited field.

#### 11 Globals

VA FileMan's globals are listed below:

- ^DD
- ^DDA
- ^DI
- ^DIA
- ^DIAR
- ^DIBT
- ^DIC
- ^DIE
- ^DIPT
- ^DIST
- ^DISV
- ^DIZ
- ^DMSQ
- ^DOPT
- ^DOSV
- ^TMP
- ^UTILITY
- ^%ZOSF

**REF:** For a description of these globals, see Table 4.

The ^UTILITY and ^TMP globals are temporary globals used and then KILLed by many VA FileMan options. The ^%ZOSF global is used by the Screen Editor and ScreenMan. If VA FileMan is used with Kernel, nodes in ^%ZOSF are set up during Kernel's installation.

**REF:** For details about setting up the ^%ZOSF nodes at standalone sites, see the *VA FileMan Installation Guide*.

There is a supported entry point to the ^DD global: ^DD("DD"). Its use is explained in the "X ^DD("DD")—Another Way to Convert Dates" section in the "Date/Time Utilities" section found in the "Classic FileMan" section (listed by category) in the "Major APIs" section in the *VA FileMan Developer's Guide*.

**REF:** For specific information on ^%DT, see the "^%DT" section in the "Classic FileMan API" section in the "Major APIs" section in the *VA FileMan Developer's Guide*.

^DD("VERSION") can be read to get the version number of the VA FileMan package that exists in the system.

## 11.1 Global Journaling, Translation, and Replication

This section contains recommendations for maintaining VA FileMan globals:

- Journaling
- Translation

**NOTE:** Translation is called "impliciting" when running M/SQL.

Replication

#### 11.1.1 Journaling

Journaling is recommended for the following globals:

- ^DD
- ^DI
- ^DIBT
- ^DIC
- ^DIE
- ^DIPT
- ^DIST
- ^DIZ

**NOTE:** The ^DIZ global is the default location for locally-produced files. Management of this global should be decided locally.

Do not journal (translation is optional) the ^DISV global.

#### 11.1.2 Translation

Translation is *recommended* for the following globals:

- ^DDA
- ^DIA
- ^DIBT
- ^DIC
- ^DIZ

**NOTE:** The ^DIZ global is the default location for locally-produced files. Management of this global should be decided locally.

# 11.1.3 Replication

Replication is recommended for the following globals:

- ^DD
- ^DI
- ^DIAR
- ^DIE
- ^DIPT
- ^DIST
- ^DMSQ
- ^DOPT

## 12 Security

VA FileMan is the database management system for Veterans Health Information Systems and Technology Architecture (VistA). As such, it provides security on a file, field, and template level. This security is based on a string of characters stored in the DUZ(0) local variable. You can find the details of the data security system imposed by VA FileMan in the VA FileMan Advanced User Manual. The security mechanisms described apply to the files and data sent with the VA FileMan software as well as to the files created by other applications and by users.

**REF:** For specific information on VA FileMan's data security, see the "Data Security" section in the "Security" section in the VA FileMan Advanced User Manual.

When used with Kernel, other types of access control are available. Kernel's Sign-on/Security component is described in the *Kernel Systems Management Guide*. If Kernel's File Access Security system has been implemented on your system, you can use it to control user access to files.

When you use VA FileMan within the Kernel's menu system, you are subject to the Kernel's security requirements:

- You *must* enter correct Access and Verify codes.
- You can only use menus and options to which you have been granted access.
- You *must* have the proper security keys to use certain locked options.

The VA FileMan menus are found on the DIUSER menu. This menu is usually located on the EVE menu distributed with Kernel.

**REF:** For a diagram of the complete menu tree for VA FileMan, see <u>Figure 3</u> in the "<u>Exported Options</u>" section.

## 12.1 Security Management

This software was developed at the Department of Veterans Affairs (VA) by employees of the Federal Government in the course of their official duties. Pursuant to title 17 Section 105 of the United States Code this software is *not* subject to copyright protection and is in the public domain. VA assumes no responsibility whatsoever for its use by other parties, and makes no guarantees, expressed or implied, about its quality, reliability, or any other characteristic. We would appreciate acknowledgement if the software is used. This software can be redistributed and/or modified freely provided that any derivative works bear some notice that they are derived from it, and any modified versions bear some notice that they have been modified.

## 12.2 Mail Groups and Alerts

VA FileMan does *not* make use of mail groups or alerts.

#### 12.3 Remote Systems

VA FileMan does *not* transmit data to any remote system, facility, or database.

## 12.4 Interfacing

No *non*-VA products are embedded in or required by VA FileMan, other than those provided by the underlying operating systems.

## 12.5 Electronic Signatures

Electronic signatures are not used within VA FileMan.

## 12.6 Security Keys

VA FileMan options are locked with the security keys described in <u>Table 20</u>. The security keys in the XU namespace are distributed by Kernel; however, they lock VA FileMan options. The two remaining security keys are distributed by VA FileMan and are installed when DINIT is run:

Table 20. VA FileMan Security Keys

Security Key	Description
XUAUDITING	Use this security key to access the Auditing menu or to run any of the Auditing options.
XUFILEGRAM	Use this security key to access the Filegram menu or to run any of the Filegram options; except the View Filegram option, for which no security key is required.
XUMGR	Use this security key for users who act as site management staff. It is required in order to access the VA FileMan Management menu. It is also needed to access many Kernel options.
XUPROGMODE	Use this security key to access the SQLI Regenerate SQLI Projection and Purge SQLI Data options.
XUSCREENMAN	Use this security key to access the ScreenMan menu.
DDXP-DEFINE	Use this security key to access the Export Tool's Define Foreign File Format option.
DIEXTRACT	Use this security key to access the Extract Data to FileMan File menu.

## 12.7 File Security

Files with numbers less than two (2) belong to VA FileMan. In general, these files *cannot* be directly accessed. You can access them only through the menu options. Those users who are granted programmer access [DUZ(0)="@"] can directly read and manipulate data in VA FileMan files. However, it is *strongly recommended* that changes to data in such files only be made through documented VA FileMan utilities.

#### 12.8 References

The following directive specifies that VA FileMan routines and files should *not* be altered:

Veterans Health Administration (VHA) Directive 10-93-142

#### 12.9 Official Policies

Modification of any part of the VA FileMan software is not permitted as per VHA Directive 10-93-142.

Distribution of the VA FileMan software is unrestricted (see the "Software Disclaimer" section).

## 13 Troubleshooting

There are no known issues or anomalies with VA FileMan 22.0.

For product support, contact the National Help Desk.

#### 13.1 How to Obtain Technical Information Online

Exported VistA M Server-based software file, routine, and global documentation can be generated through the use of Kernel, MailMan, and VA FileMan utilities.

**NOTE:** Methods of obtaining specific technical information online are indicated where applicable under the appropriate section.

## 13.2 Help at Prompts

VistA M Server-based software provides online help and commonly used system default prompts. Users are encouraged to enter question marks at any response prompt. At the end of the help display, you are immediately returned to the point from which you started. This is an easy way to learn about any aspect of the software.

# Glossary

## Table 21Table 22. Glossary

Term	Description
ANSI STANDARD MUMPS	American National Standards Institute (ANSI) computer language used by VA FileMan. Also called M. The acronym MUMPS stands for Massachusetts General Hospital Utility Multiprogramming System.
ARCHIVING	The storing of historical or little used data offline (often on tape).
AUDITING	The monitoring and recording of computer use. VA FileMan audits can log changes to data values in files and to the structure of the file itself.
BROWSER	An interactive application in VA FileMan that displays ASCII text on a terminal that supports a scroll region. The text can be in the form of a VA FileMan WORD-PROCESSING-type field or sequential local or global array. The user is allowed to navigate freely within the document.
CALLABLE ENTRY POINTS	Places in a VA FileMan routine that can be called from an application program.
CHECKSUM VALUE	A number computed for each routine in a package. The number is used to verify that the routine is uncorrupted and unchanged. Any coding change to a routine changes its checksum value.
CROSS-REFERENCE	In VA FileMan, an attribute of a field that identifies an action to take place when the value of the field is changed. Often, the action is the placement of the field's value into an index. In Version 22.0 of VA FileMan, the INDEX file allows creation of indexes that contain more than one data field. Thus, they become an attribute of the file, rather than of a single field. The action described in the INDEX file entry happens when any of the involved fields is changed.
DATA DICTIONARY	A data dictionary (DD) contains the definitions of a file's elements (fields or data attributes), relationships to other files, and structure or design.
DATABASE MANAGEMENT SYSTEM	A collection of software that handles the storage, retrieval and updating of records in a database.
DBS	Database Server: an Application Programmer Interface (API) for VA FileMan that updates the database in a non-interactive mode. VA FileMan passes information that needs to be displayed to the user to the calling routine in arrays.
DBMS	Database Management System.
DEVICE	A terminal, printer, modem or other type of hardware or equipment associated with a computer. A Host file of an underlying operating system may be treated like a device in that it can be written to (e.g., for spooling).
DHCP	The Decentralized Hospital Computer Program, see "VistA."
DIRECT MODE UTILITY	An entry point into a routine that can only be called from programmer mode, see "Callable Entry Points."
DSM FOR OPENVMS	The current name for VAX DSM(V6). One of the M operating systems supported by VA FileMan.

Term	Description
ENTRY	For VA FileMan, an instance of a file; a set of logically related data in a file; a record.
FIELD	In an entry, a specified area used for the value of a data attribute. The data specifications of each VA FileMan field are documented in the file's data dictionary.
FILE	A set of related records (or entries) treated as a unit.
FILEGRAMS	A VA FileMan feature that stores file information in a sequential format in preparation for archiving or for sending it to a corresponding database in another computing location.
GLOBAL	In M, global may refer to a variable stored on disk ("global variable") or the array to which the global variable may belong ("global array").
HELP FRAMES	Online screens of documentation made possible by the Kernel's Help Processor.
IMPLICITING	Term used by M/SQL operating system for global translation.
INIT	A step in the installation process that builds VA FileMan files from a set of routines (the "init routines"). Shortened form for "initialization."
INDEX	A part of the data global whose subscripts are one or more fields from a single record in the file, along with the internal entry number (or numbers) that locate the record. An ordered list of all or a subset of the records in the file used to facilitate lookup and sorting.
INDEX FILE	This file was introduced with VA FileMan 22.0. Contains the information that describes an index on a file. Old-style index information is stored descendent from the description of the indexed field in the data dictionary. The INDEX file allows the creation of more complex indexes.
JOURNALING	The capturing of changes to files in order to facilitate the restoring of files from a known prior state.
KERNEL	A set of VistA software utilities that function as an intermediary between the host operating system and VistA application packages (e.g., Laboratory, Pharmacy, IFCAP, etc.). Kernel provides a standard and consistent user and programmer interface between application packages and the underlying M implementation.
KEY	A group of one or more fields that together uniquely identifies a record in a file. Each key field <i>must</i> have a value, and fields that make up a key <i>must</i> in combination be unique for all records in the file. VA FileMan enforces key integrity.
KEY VARIABLE	See "Package-wide Variable" below.
LAYGO ACCESS	A user's authorization to create a new entry when editing a computer file. Learn As You GO: the ability to create new entries.
MAILMAN	An electronic mail system (e-mail) that allows you to send messages to and receive them from other users via the computer. It is part of VistA.
MAPPING	See "Routine Mapping.

Term	Description
OPERATING SYSTEM	A basic program that runs on the computer, controls the peripherals, allocates computing time to each user, and communicates with terminals. Some M implementations take over the functions of an operating system completely; others run on top of another host operating system.
PACKAGE	The set of programs, files, documentation, online help, and installation procedures required for a given software application package identified by a unique namespace. Elements include routines, files, and file entries from the OPTION, KEY, HELP FRAME, BULLETIN, FUNCTION, SORT TEMPLATE, PRINT TEMPLATE, INPUT TEMPLATE, FORM, and BLOCK files. Packages are transported using VA FileMan's DIFROM routine, which creates initialization (init) routines to bundle the files and entries for export.
PACKAGE-WIDE VARIABLE	For VistA, a variable that, for a particular application package, has a standard and documented meaning. Some package-wide variables may need to be defined at all times during package use. Also called Key Variable.
POINTER RELATIONSHIPS	In VA FileMan, links between files that are created by use of the POINTER TO A FILE or VARIABLE-POINTER DATA TYPEs.
PROGRAMMER ACCESS	The ability to utilize VA FileMan features that are reserved for application developers. Referred to as "having the at-sign (@)", because "@" is the DUZ(0) value that grants programmer access.
PROGRAMMER MODE	Entry into VA FileMan directly from the M prompt instead of from Kernel's menu system (e.g., by entering D P^DI at the M prompt).
REPLICATION (OF GLOBALS)	The practice of keeping and maintaining identical copies of the same global in different physical locations.
ROUTINE	A program or a sequence of instructions called by a program that may have some general or frequent use. M routines are groups of program lines that are saved, loaded, and called as a single unit via a specific name.
ROUTINE MAPPING	The placement of routines into main memory. Frequently used routines are mapped to reduce disk access and thereby increase efficiency.
SAC EXEMPTION	An exception specifically granted by the Standards and Conventions Committee of the Programming Standards and Conventions requirements.
SCREENMAN	A VA FileMan screen-oriented utility that supports creation, alteration, and presentation of screens for data editing and data display.
SDP SPACE	Sequential Disk Processor space is an area on disk set aside for temporary storage of data during copying of the data. SDP is implemented by some M systems.
SPACEBAR RETURN or SPACEBAR ENTER	The use of the key combination <b><spacebar><return></return></spacebar></b> or <b><spacebar><enter></enter></spacebar></b> at a prompt. VA FileMan retrieves the user's last response to that prompt.
STANDALONE	Referring to VA FileMan, the use of VA FileMan without the complete Kernel. The rest of Kernel adds functionality; however, VA FileMan can be used alone.

Term	Description
TEMPLATE	A means of storing report formats, data entry formats, and sorted entry sequences. A template is a permanent place to store selected field specifications for use at a later time.
TRANSLATION (OF GLOBALS)	The pointing to a physical disk storage location in another UCI for location of a global. Allows the same globals to be accessed from multiple UCIs.
VISTA	The Veterans Health Information Systems and Technology Architecture, within the Department of Veterans Affairs, is the component of the Veterans Health Administration that develops software and installs, maintains, and updates compatible computer systems in VA medical facilities. (Previously known as the Decentralized Hospital Computer Program [DHCP].)
